Project 2 instructions (individuals)

Build a product that could only come from!

This is a challenge where you use AI to build a personal portfolio that represents who you are and what you can do.

You'll start with a simple prompt to create your first portfolio, then improve your prompts and refine your design, content, and features as you learn more about AI. Along the way, you'll test your portfolio, identify what needs improvement, and discover how better prompts can lead to better results.

By the end, you'll have a polished portfolio that showcases your skills, projects, personality, and career goals, along with a clear understanding of how much your prompt engineering skills have improved.

NOTE!

You will present two versions of your project: the first built with weak prompts to show your starting point, and the second refined into a polished MVP that reflects who you are and is ready to share with the world.

Prompts Cheat Sheet

create Portfolio Studio

Act as a senior product designer, creative director, and full-stack developer. Build a production-ready web application that helps me create and compare two versions of my personal portfolio using AI.

The application should provide a polished and intuitive experience that allows me to experiment with different prompts, see how they affect my results, and improve my portfolio over time.

1. Create Two Portfolio Workspaces

Provide two independent workspaces where I can create different versions of my personal portfolio.

Portfolio Version A

- Let me enter a prompt describing the portfolio I want to build.
- Follow my prompt as written without silently improving or rewriting it.
- Generate a functional portfolio based on the instructions I provide.

Portfolio Version B

- Let me enter a different prompt to create an alternative version of my portfolio.
- Follow the instructions carefully and implement the requested design, animations, functionality, responsiveness, and other requirements.
- Keep this version independent from Version A.

Both versions must use the same personal information, skills, projects, achievements, and career goals so I can fairly compare the results.

2. Compare My Results

Create a side-by-side comparison experience that lets me preview both portfolios and understand their differences.

Allow me to compare visual design, functionality, user experience, responsiveness, content quality, and completeness. Show the original prompt used for each version and identify which requirements were fulfilled or missed.

Keep the evaluation neutral. Do not intentionally make either version worse or better than its prompt justifies.

3. Help Me Improve

Allow me to revise my prompts, generate new versions, and review previous results. Preserve prompt history so I can understand how my instructions evolve and how each change affects the final product.

4. Create a Beautiful, Production-Ready Interface

Give the application a distinctive visual identity with sophisticated typography, refined layouts, smooth animations, thoughtful micro-interactions, and responsive design. Make the experience feel like a professional product rather than a classroom demo.

Ensure the interface is accessible, fast, intuitive, and usable across desktop, tablet, and mobile.

5. Ensure Reliability and Security

Build a working application rather than a static mockup. Implement proper loading and error states, input validation, and reliable data persistence. Protect my personal information, keep API keys and credentials secure, and ensure generated portfolio previews are handled safely.

Test the main user journeys and fix critical issues. If AI generation or publishing requires an external service that is not configured, clearly identify the missing integration instead of pretending it works.

Final Goal: Help me build two versions of my own portfolio, compare the outcomes, and discover how better prompts can lead to better products. The experience should be visually impressive, technically reliable, and ready to evolve into a real production application.

Step #1: Reveal Yourself

Strong Prompt	Weak Prompt
Act as a professional portfolio designer and web developer. Help me build a modern, interactive portfolio that I can share with companies and recruiters to showcase my skills, projects, education, interests, and career goals. Start by asking me questions about my background, technical skills, achievements, projects, and the roles I want to pursue. Use my answers to create a portfolio that reflects my personality while presenting me professionally. Organize the content into clear sections and highlight my strongest projects with their goals, my contributions, technologies used, and results where available. Create a unique visual identity with clean layouts, readable typography, smooth animations, and responsive design across mobile, tablet, and desktop. Make the portfolio easy to navigate and include working links and a clear way for recruiters to explore my work and contact me through a method I approve. Do not invent achievements, skills, experience, or results. Include only information I approve for public sharing and never expose sensitive personal details, credentials, or confidential information. Build a functional MVP rather than a static mockup. Before presenting the final version, test the main interactions, navigation, responsiveness, and content accuracy, fix any issues you find, and summarize what is ready to share and what still needs attention.	Build me a personal website that looks modern and includes information about me.

Step #2: Make It Real

Strong Prompt	Weak Prompt
Improve my existing portfolio to make it professional, engaging, and ready to share with recruiters. Review the current version and improve the layout so my skills, career goals, and strongest projects are easy to discover. Present each project with its purpose, my contribution, technologies used, and results where available. Create a consistent visual style with balanced spacing, readable typography, suitable colors, and smooth animations that enhance the experience without slowing it down or distracting users. Make the portfolio responsive across mobile, tablet, and desktop. Ensure all buttons, links, project demos, and contact options work correctly. Keep all information accurate and only publish details I have approved for sharing. Protect personal data, prevent exposure of passwords, API keys, and other confidential information, and follow secure development practices. Check accessibility, loading performance, and compatibility across screen sizes. Test the main user journeys, fix broken features and visual issues, and review the application for common security risks before deployment. Finally, summarize what works, what has been tested, and anything that still needs attention before the portfolio is shared publicly.	Make my portfolio look better and add some cool features so recruiters will like it.

Step #3: The Blind Test

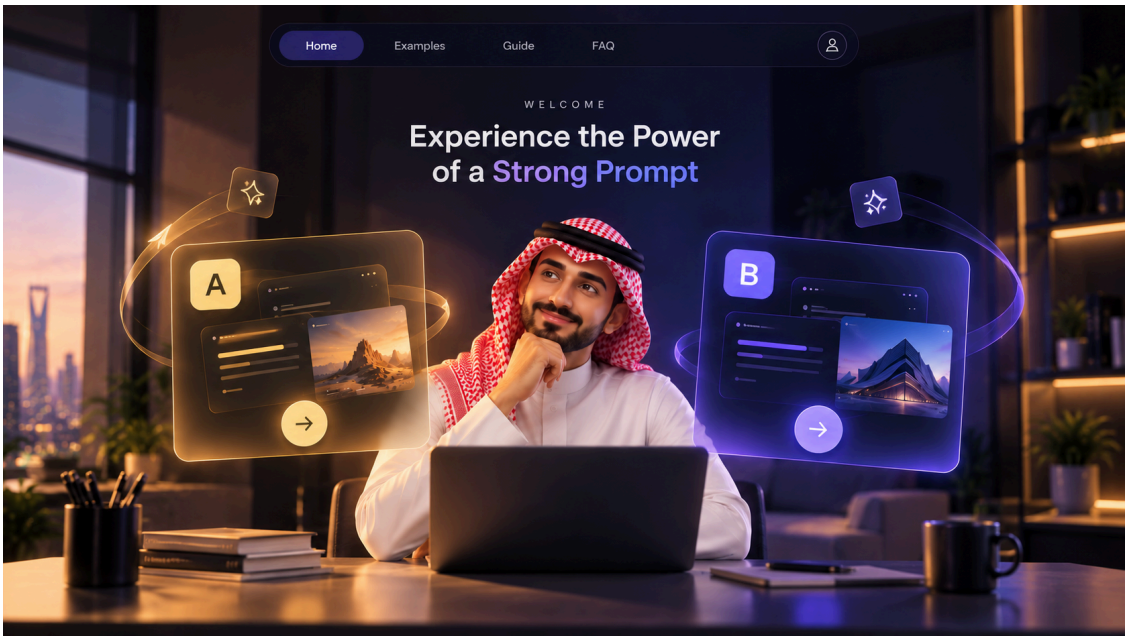

Strong Prompt	Weak Prompt
Review my portfolio from the perspective of a recruiter who is visiting it for the first time. Test whether a visitor can quickly understand who I am, identify my key skills, explore my projects, understand my contributions, and find my approved contact options without any guidance. Check all navigation links, buttons, project demos, and interactive elements. Test the experience on mobile and desktop and look for confusing layouts, broken interactions, slow loading, and accessibility issues. Review the published content for inaccurate claims or personal information that should not be public, and check for common security risks without exposing or collecting sensitive data. Record each issue you find, explain its impact on the visitor, and suggest a specific improvement. Prioritize the most important problems and fix them where possible without breaking existing features. Retest the affected areas and summarize the results, including any issues that remain unresolved.	Test my portfolio and tell me if it works.

Step #4: Make It Unforgettable!

Strong Prompt	Weak Prompt
Act as a world-class creative director, UI/UX designer, and frontend developer. Transform my existing portfolio into a premium, visually stunning, and memorable digital experience that reflects my personality and makes recruiters want to explore my work. Create a distinctive visual identity with sophisticated typography, beautiful layouts, balanced spacing, depth, and carefully chosen colors. Introduce advanced motion design such as scroll-triggered storytelling, animated typography, smooth page transitions, parallax effects, interactive project cards, magnetic buttons, and elegant micro-interactions. Design a captivating opening section and make each part of the portfolio feel like a connected visual journey. Ensure every animation has a purpose, feels smooth, and enhances the experience rather than distracting visitors. Make all interactions functional and intuitive, and adapt the design and animations for mobile, tablet, and desktop. Preserve the accuracy of my information and never invent achievements or publish private details. Follow secure development practices, respect accessibility and reduced-motion preferences, and optimize performance so the experience remains fast and responsive. Implement the improvements directly in the existing project without breaking working features. Test the navigation, interactions, responsiveness, accessibility, and loading performance, then fix any issues you find. Finally, review the result critically and refine anything that still feels generic, unfinished, or visually weak. The final portfolio should feel original, polished, and award-worthy while clearly communicating who I am, what I can do, and why recruiters should remember me.	Make my portfolio look very beautiful with cool animations and impressive effects.
